

**ABSTRACT**

The invention relates to absorbent articles, such as diapers, training pants, adult incontinence articles, feminine protection articles and the like having a specific anal or vaginal cuff with an opening, which is sag-tolerable. The articles have a specific construction of a core, backsheet and the cuff, which each have specific dimension, in relation to one another. Preferred is for example that that the cuff has elasticated regions along the opening and that the cuff is (non-elastically) extendible in transverse direction, having for example longitudinal folds which easily unfold and extend the cuff in transverse direction, ensuring the cuff does not sag when the backsheet and care sack due to soiling.
